HIP PROSTHESIS: VERSAFITCUP® CC Trio

CAUTION
Federal law (USA) restricts this device to sale distribution and use by or on the order of physician.

ENGLISH
VERSAFITCUP® CC Trio - INSTRUCTIONS FOR USE

Important notice: the device(s) can be prescribed and implanted only by a doctor legally authorized to perform this type of surgery.

GENERAL
Before any surgery, the surgeon must be familiar with the sales product literature and operative technique and must carefully read these instructions for use. Patient selection is as important as implant placement or positioning. Overweight patients or unsuitable functional requirements may generate exceptional stresses and reduce the implant life. The warnings must be heeded, and the instructions for use must be strictly followed.

PRODUCT DESCRIPTION
A hip prosthesis consists of a femoral stem made of metal, a modular femoral head made of metal or ceramic, and acetabular components. The acetabular components consists of a metal cup, and a liner that is made of ultra-high molecular weight polyethylene (UHMWPE) or Highcross® highly crosslinked ultra-high molecular weight polyethylene (HXUHMWPE). All the auxiliary components of the prosthesis are supplied in single-use individual packages.

INTENDED USE / INDICATIONS
The hip prosthesis is designed for cementless use in total hip arthroplasty in primary or revision surgery. The patient should be skeletally mature. The patient's condition should be due to one or more of:
- Severely painful and/or disabled joint: as a result of osteoarthritis, post-traumatic arthritis, rheumatoid arthritis or psoriatic arthritis, Congenital hip dysplasia, Arthrophylyis spondylitis.
- Avascular necrosis of the femoral head.
- Acute traumatic fracture of the femoral head or neck.
- Failure of previous hip surgery: joint reconstruction, internal fixation, arthrodesis, hemiarthroplasty, surface replacement arthroplasty, or total hip replacement where sufficient bone stock is present.

CONTRAINDICATIONS
Total or partial hip replacement is contraindicated in the following cases:
- Acute, systemic or chronic infection.
- Muscular, neurological or vascular deficiency of the affected limb.
- Bone destruction or loss of bone characteristics that may compromise the stability of the implant.
- Pathologies that may compromise the functionality of the implant in any way.

The surgeon's responsibility to ensure that the patient has no known allergy to the materials used.

WARNINGS AND PRECAUTIONS
The success of the operation depends on compliance with the operative technique supplied, and the proper use of the instrumentation supplied and specially designed for that range of implants. The trial instrumentation must be used to confirm the choice of sizes and verify the functionality of the joint. The label shows the size of the taper cone. The surgeon should check the stem-head fit before assembly. The Versafitcup® CC Trio has not been evaluated for safety and compatibility in the MR environment. The Versafitcup CC Trio has not been tested for heating or migration in the MR environment.

MEDACTA INTERNATIONAL PLANTS
Under no circumstances should a Medacta® International modular implant component be used in combination with a component from another manufacturer, unless otherwise specified by Medacta® International. Only authorized Medacta® combinations should be used. To determine whether these devices have been authorized for use in a proposed combination, please contact your Medacta® sales representative or visit the Medacta® website: www.medacta.com.

The components of a hip prosthesis should never be reimplanted. While an implant may appear undamaged, microscopic imperfections may occur and cause implant failure.

The surgeon should use a trial prosthesis for trial purposes only. Trial prostheses should not be assembled with components intended for permanent placement. Never adapt or alter trial prostheses.

When changing a prosthetic head on a femoral stem in place, it is essential to use a metal head. UHMWPE implants should be stored for at least three hours at 20°C (+/- 3°C) before the operation.

RISK FACTORS
The following conditions, individually or together, may cause excessive loading of the affected limb, exposing the patient to greater risk of a hip arthroplasty failure:
- Obesity or overweight of the patient, depending on the type of implant
- Hard manual work
- Intensive sporting activity
- High level of activity
- Probability of falling
- Alcoholism or drug addiction
- Other handicaps which could compromise the outcome of the operation.

The following conditions, individually or together, will make fixation of the hip prosthesis challenging:
- Advanced osteoporosis or insufficient bone stock
- Metabolic disorders or systemic medications leading to gradual loss of bone support for the prosthesis (e.g. diabetes Mellitus, treatment by steroids, immunosuppressives, etc.)
- History of disseminated systemic or local infection
- Significant deformations preventing correct fixation or placement of the prosthesis
- Tumours of the supporting bone structures
- Allergic reactions to the prosthesis materials (e.g. cement, metal, polyethylene)
- Tissue reaction to implant corrosion or wear debris
- Functional incapacity of the other joints.

INSTRUCTIONS FOR USE

PREOPERATIVE PHASE
The surgeon should discuss with the patient their physical and mental limitations, as well as all the details of the procedure and prosthesis. The discussion should consider the limitations of the procedure and the constraints imposed by the selected implant. The factors which could limit the performance and stability of the implant, e.g. level of activity, patient's weight, should be set out to improve the patient's chances to avoid complications. The necessity to follow the postoperative instructions given by the surgeon should be fully understood by the patient. A stock of sterile implants of suitable sizes should be available and checked before surgery.

HANDLING
To avoid scratching or damaging the implants, these should be handled with the utmost care by qualified personnel and in an environment where conditions of hygiene are controlled. The implants should be kept in their undamaged packages until needed for use. Do not use implants from opened packages, that are damaged, or that are beyond their expiration date.

SURGICAL TECHNIQUE
The surgeon should be familiar with the surgical technique. Supplementary information about the surgical techniques (brochure and video) and products are available on request. Careful preoperative planning, documented by X-rays, is essential. X-ray templates are only available for most implants. Note that the final acetalaulum implant should be press fit into the prepared acetabulum without threading.

POSTOPERATIVE CARE AND FOLLOW-UP
The surgeon should take the patient to control their level of activity and avoid excessive loads on the replaced joint, and make them aware of the precautions to be taken with regards to exercise, treatments and limitations on activities, as well as avoiding exposure to magnetic fields. Periodic follow-up and X-rays are recommended to make comparisons with the immediate postoperative condition and identify implant displacement, loosening, etc. Excessive physical activity, and operated limb traumas may cause early failure of the arthroplasty through implant displacement, fracture and/or wear. If the case occurs, it is necessary to place the patient under supervision, evaluate the possible progression of the deterioration, and weigh the benefit of early revision.

ADVERSE EFFECTS AND COMPLICATIONS
GENERAL
- Prosthesis dislocation, often related to the above-mentioned risk factors.
- Early or late loosening of the prosthetic components, often related to the above-mentioned risk factors.
- Fracture failure of the stem femoral, often related to the above-mentioned risk factors.
- Wear of the polyethylene component or fracture of the liner or head, often related to the above-mentioned risk factors.
- Early or late infection.
- Neuropathies. Intra-operative lesion of a nerve, due to surgical trauma.
- Tissue reactions, osteolysis and/or implant loosening caused by metal corrosion, allergy, wear debris, or loose cement particles.

INTRA-OPERATIVE
- Cup perforation.
- Femur diaphysis perforation, crack or fracture that may require internal fixation.
- Trenchartery fracture.
- Vascular damage (iliac, obturator and femoral arteries).
- Temporary or permanent nerve damage (femoral, obturator or sciatic nerve).
- Subluxation or dislocation due to wrong size selection or wrong prosthesis configuration, malposition of the components and/or lossy of the muscles and connective tissue.
- Lengthening or shortening of the operative side.

IMMEDIATE POSTOPERATIVE
- Cardiovascular disorders, including vein thrombosis, embolism, and myocardial infarction.
- Haematoma and/or delayed healing.
- Pneumonia and/or atelectasis.
- Subluxation or dislocation.

LATE POSTOPERATIVE
- Avulsion of the trochanter resulting from excessive muscle tension or overloading.
- Aggravation of the problems with the knee and ankle of the ipsilateral or contralateral limb caused by difference in leg length, femur displacement and/or muscular deficiency.
- Fracture of the femur or acetabular cup resulting from trauma or overloading, especially because of poor bone stock resulting from severe osteoporosis, bone lesions, revision surgery, intra-operative reaming or bone resorption.
- Bone reaction which may damage the fixation or result in implant loosening.
- Periprosthetic calcification or ossification which may reduce mobility and the articular range of motion.
- Traumatic arthritis of the iliospinal knee, due to the position of the limb during the operation.
- Infection and severity of the complications related to hip revision are usually higher with revision surgery than with primary surgery. Common problems during revision surgery may include the difficulty of finding where to make the incision, the resection of sequesstra and old bone cement, the placement and fixation of the components and others on the search for adequate bone support. During revision surgery, there is an increased risk of longer operative times, blood losses and higher incidence of infection, embolism and haematoma.

PACKAGING
All the implant components of a total or partial hip prosthesis are supplied in single-use individual packages. For components delivered sterile, the sterilization method is indicated on the label. The expiration date and package integrity must be checked to ensure that sterility of the contents has not been compromised. If the package is damaged, do not use the component. Do not resterilize.

INSTRUMENTS
Instruments are supplied non-sterile and must be cleaned and sterilized prior to use. Recommended cleaning, decontamination and sterilization instructions are provided on www.medacta.com.

STORAGE
The packages must be stored in a cool, dry place, away from light.
